

Digital Document Identification Image Annotation & Bates Numbering Module For Kofax Capture

Hershey Technologies' Annotation Module for Kofax Capture¹ is a powerful and flexible solution allowing automated digital document identification and annotation services.

The Annotation module annotates:

- Constants, such as text strings.
- Auto-incrementing numbers
- Dynamic information from index fields or Kofax system values.

Annotations can appear as separate expressions on a page or they can be concatenated to create a single annotation. The Annotation Module is ideal for bates numbering applications. Annotations may contain prefixes, suffixes, auto-numbering and date/time stamps. Additionally, the Annotation Module can provide annotated information for purposes of identification, protection, and auto-increment numbering.

Key Features:

- ✓ Improves digital document identification, ownership rights and guidance.
- ✓ Certified for Kofax Capture v8 and v9 in a standalone or network implementation.
- ✓ Runs as an unattended Windows Service or as a Module
- ✓ Can preserve original document information by preventing annotations from covering any of the original images. (Using Canvas Grow or Image Resize features)
- ✓ Annotates images from both scan *and* Kofax *Import* functions (FAX, Image, and Email Attachments).
- ✓ Specifies which page or ranges of pages in a document to be annotated.
- ✓ Orients annotation in any direction on the page. (e.g., 90 degrees written alongside right margin).
- ✓ Can use any batch field or document index field to create dynamic annotations.
- ✓ Supports customizable annotation expressions, which may contain any combination of auto incrementing page counters, index field values and static text (e.g. "0099-HERSHEY CUSTOMER: Doe, John").
- ✓ Page counters can span both documents and batches.
- ✓ Can perform multiple annotations on single page.
- ✓ Annotates with Kofax system values (e.g. {Batch Name} or {Current Date}).
- ✓ Supports UNLIMITED Annotations per month (Non-Metered License).
